Lab 4 Chat History Export

Vibe Coding Helicopter Game

This export records the prompts and implementation decisions used while completing the four README tasks. The assigned repository was inspected first, then each task was implemented and committed separately.

Prompt 1 Repository inspection

> User: Clone the assigned helicopter repository, read its README, run the Python game, and complete Lab 4 according to the listed deliverables.

Assistant action: Cloned SETAPESU26/08_helicopter, inspected the README and game modules, identified the four requested tasks, installed Pygame, and captured a verified 10-second before-change video.

Prompt 2 Movement and boundary fix

Assistant implementation: Added a maximum vertical speed, immediate direction reversal, and top and bottom boundary clamping that accounts for the helicopter's height.

Result: committed as 38143e4 - Fix helicopter movement and screen boundaries.

Prompt 3 Collision and game over

Assistant implementation: Added wall collision detection for obstacle pairs, a game-over state, a visible game-over banner, and R-to-restart behavior.

Result: committed as d74a940 - Add obstacle collision and game over state.

Prompt 4 Distance scoring

Assistant implementation: Added a distance counter that advances while the game is active, displays in the HUD, remains visible in the game-over banner, and resets with a new game.

Result: committed as 156e40e - Add distance scoring and restart reset.

Prompt 5 One-hit shield

Assistant implementation: Added S-key activation, a visible shield ring and HUD status, one collision absorption, and shield deactivation immediately after absorbing a hit. A second collision remains fatal.

Result: committed as eb7f2c3 - Add one-hit shield mechanic and HUD indicator.

Verification summary

Check	Result
Task 1 movement and boundaries	Implemented and manually tested
Task 2 collision and game over	Collision and restart checks passed
Task 3 distance scoring	Increment and reset checks passed

Check	Result
Task 4 shield	One-hit shield checks passed
Before video	10.000 seconds
After video	10.000 seconds
